SPRING KIT "23"

Instructions for Fitting

This kit consists of two special spring clips and two 1/4" long round head machine screws. It is intended to convert Graphic Backs to accept the Graphic Roll Holders and the Graphic Film Pack Adapters.

Remove the screws holding the top and bottom focusing panel springs. It may be necessary to place a small drop of alcohol around the screw if it is locked in place. A small cross-point screwdriver will fit the screws in the Pacemaker Graphic Cameras and a standard flat bladed screwdriver will fit other cameras.

Place the focusing panel and springs to one side for future use. Be careful not to lose the large washers between the springs and the back of the camera on Minature Graphic Cameras, or the small washers on the pins of the panels from the Pacemaker Graphics.

Keep the large washers in place on the back of the camera and place the roll holder on the back with the carriage removed and the cover open. Position the clip "feet" close against the side walls of the back, and tighten down with the screws removed from the focusing panel springs or those provided herewith.

NOTE: If the holder is pulled backward against the clips, the "foot" or end of the spring, which must be small to allow use on different cameras, may snap off the top of the face plate of the holder. It will then hold the roll holder away from the back and allow light to leak in and fog the film. To reset, pull the spring up and snap over the top of the face plate of the roll holder, or remove entirely and refit as above.

Although it is not intended to be readily interchangeable when those spring clips are used, the Graphic Roll Holder can be removed and the film pack adaptor used interchangeably with it.

The roll holder may be removed, even when loaded, by removal of the lower spring clip. The recess in the bottom of roll holder carriage allows access to the screw holding this clip in place.

If the roll holder is not loaded, it may not be necessary to remove this clip. Open the cover, remove the carriage, lift the base away from the camera back and slide out. However, unless the clips are lifted slightly, they will scratch the finish of the holder. When attaching the film pack adapter or refitting the roll holder, it may be necessary to lift the springs up a little. Note that the roll holder carriage must be removed and the cover must be open.

NOTE: If the back of the camera is fitted with wood rather than machine screws, do not attempt frequent removal and refitting of the clips, since the holes will become enlarged and the screws will not hold.
