I have no connection with any camera company

On-line camera manual library
This is the full text and images from the manual. This may take 3 full minutes for the PDF file to download.

If you find this manual useful, how about a donation of $3 to: M. Butkus, 29 Lake Ave., High Bridge, NJ 08829-1701 and send your e-mail address so I can thank you. Most other places would charge you $7.50 for an electronic copy or $18.00 for a hard to read Xerox copy.

This will allow me to continue to buy new manuals and pay their shipping costs. It'll make you feel better, won't it?

If you use Pay Pal or wish to use your credit card, click on the secure site on my main page.

www.butkus.us www.PayPal.me/butkus
Please read
the entire booklet later. As a beginning,

the first four pages

will suffice!

This short introduction will tell you in rapid
fashion all you need to know when you take
the camera in hand for the first time. At the
same time it is an outline of the contents of
the pages which follow. There you will find a
more detailed illustrated description of how to
work with the Rolleiflex T, and basic technical
data for further applications.

The electric exposure meter and mask set “16”
are important accessories for the Rolleiflex T.
Accordingly, they are also dealt with in this
booklet. The Useful Accessories booklet gives
detailed information on the many special Rollei
accessories.

ROLLEI-WERKE FRANKE & HEIDECKE

Shortened Instructions

Loading the Camera:

1. Unlatch back (1) and open.

3. Pull out the film spool retainer knob (2)
and insert the film.

4. Slip the leading edge of the film protective
paper into the long slot of the empty
spool.

5. Wind the film until the starting marks are
opposite the red dots (3) – Stop!

6. Close the back and latch.

7. Film counter on No. 1: Wind crank until
it stops and then back to stop. The shutter
is now automatically cocked, the camera
ready for shooting.

8. After each shot: Wind crank as before;
forward to stop, back to stop.
for Quick Reading

Immediately after Loading:

8 Set film reminder to DIN/ASA speed rating (21) by turning bar of film reminder dial to the right ④. Set the film type by turning to the left (black and white, colour artificial light, colour daylight, colour negative).

Unloading the Camera:

9 Roll the exposed film up by turning crank four complete rotations (⊙ in film counter window).

9 Unlatch back and open.

9 Pull out the film spool knob ⑤, remove film and seal with sticker.

7 Insert the now empty lower spool in the upper chamber, key slot to the right.
Page

Setting the Exposure Value:
15 Ascertain the exposure value from the table on the camera back or from an exposure meter.
10 Pull out lever ① and set the exposure value on scale ② (go back over scale if need be).

Diaphragm - Shutter Speed Setting:
10 Use lever ①, without pulling, for setting the desired diaphragm-shutter speed combination ③: the speed is always set so that the figure is in the middle of the window.
11 The white figures of the scale = automatically timed fractions of a second in descending order, the green figures = full seconds for time exposures by hand.

Focusing:
12 Open hood by lifting rear edge ④.
12 Raise magnifier by a slight push inwards of panel ⑤.
12 Turn focusing knob ⑥ until ground glass shows object with maximum sharpness.
16 When required: Check depth of field (7) and if necessary refocus.

Check a selected area on the ground glass, straightening the camera in accordance with the grid lines.

12 When needed, open the sports frame finder by pushing the panel (5) inwards until it catches. Tap both sides of focusing hood gently, and flap will return to normal position.

**Releasing the shutter**

13 Swing out shutter release guard (8).

13 Press release button (9) (with Time exposures: hold and release only after desired interval has elapsed. If necessary: lock release with guard).

Secure release.

13 For delayed action pictures: Swing knob (10) to V, release shutter as usual.

---

26 The Practical Accessories
To Open: lift the top from the rear and fold forward and down

Removing the Camera: swing locking lever on either side downward. Lift crank outward. Spread the sides of the case slightly and pull camera forward.

Inserting the Camera: spread the two sides of the case slightly, guide the raised crank through opening from the inside and lower the camera backwards into the case. Press the sides together and swing locking levers upward.

Detaching the Front (if required): Press clip downward, remove the front flap. To Attach: Insert the front flap in hinge and close eveready case.

Release of Neck Strap: press the retaining prongs together and pull strap. To Fasten: Insert the retaining prongs into the strap holders where they snap into position.

The designations left, right, forward, back, above, below apply to camera in normal operating position. Accordingly: left = focusing side, right = crank side, etc.
**Loading the Camera**

**Opening back:** Turn the safety back lock clip 6 in direction of arrow, lift back lock lever 7 and pull back open 8.

**Empty spool** (upper spool chamber): Insert as with new film spool, keeping key slot to the right 9.

**Inserting new film spool** (lower chamber): Pull out film spool knob, insert film, right side first 10 and allow film knob to return to position.

The tapered leading edge of the film backing paper must point in the direction it will go as the film is run off.
Starting the film. Break the paper seal and pull the film backing paper up to the empty spool; insert the tapered end into the long slot ①. Turn the crank, while braking the full spool with the left hand thumb – wind until the two printed triangular marks (or double arrows) are opposite the red dots at the sides of the film aperture frame ② – Stop!

Close the back by pressing the back with the palm of the hand, fold down the back lock lever ③ and turn back the back lock clip ④.

Winding film to shooting position: Turn crank forward to stop and back again in opposite direction to stop ⑤. Film frame counter indicates No. 1, shutter is cocked.

Setting the film type reminder (➤ page 3, 20/21).

Changing film should always be done in shade or subdued light, never in direct sunlight!
After each shot: Turn crank as before, forward to stopping point, back again to stop (5).

Double exposures and blanks are eliminated. Crank will turn only after releasing shutter. A simple rule: turn crank if it can be turned—forward and back to lock. If it is locked camera is ready for shot.

The crank need not be folded down after each shot when shooting in rapid sequence.

After the last exposure, the terminating mark (○) will appear in film counter window. The film is finished and the crank is no longer locked.

Roll up remaining backing paper with four full revolutions. Open back in subdued light. Pull out upper spool knob and remove film from the left (6). Fold backing paper cross-wise (7) and fasten down with sticker. Return exposed film to original packing.
Setting Exposure Value and Diaphragm/Shutter Speed

The lever ① acts as an automatic coupling device for diaphragm and shutter speed scales. Pulling lever outward uncouples scales, releasing lever recouples them.

1. Setting Exposure Value: Pull the lever, uncoupling the scales, and slide it up or down ① until arrow ② points to desired exposure value. If more movement is needed to bring up the desired value, re-engage scales, slide back, then repeat operation.

2. Setting diaphragm/shutter speed: Move lever ③ until desired diaphragm-shutter speed combination appears in the window ④. Always set so that shutter speed is in middle of indicator window!

3. Special Case: Setting shutter speed and diaphragm stop independently (without regard to exposure value, for example, as in flash shots): First set the speed (if necessary go back over scale), then uncouple and set diaphragm.
**Exposure Value**

The exposure value provides the basic setting of the camera to the desired exposure (➤ page 14), automatic coupling keeps exposure constant.

---

**Exposure Time**

The white section of the scale indicates the automatically timed shutter speeds in fractions of a second (for example $500 = 1/500$ second, $1 = 1$ second). The most useful shutter speed is $1/60$ second for steady shake-free shots. Let the speed lever engage exactly at the marked values; intermediate speeds cannot be set.

The green scale is for long time exposures. For cross-coupled aperture-speed combinations in this region the numbers indicate the required time exposure in full seconds.

---

**Diaphragm**

Stopping down increases depth-of-field (➤ page 16). Full diaphragm stops (from 4 to 22) as well as half stops (strokes between numbers) may be set. Half diaphragm stops are obtained when working with half exposure values. The f/3.5 diaphragm marking represents a half stop lying between stop 4 and 2.8 of the International Diaphragm Scale.

Closing down the diaphragm to the next full value cuts the effective light passing through exactly in half. To maintain exposure constant would require doubling the time shutter is open – this automatically takes place because of the coupling, exposure value remains the same.

</thead>
</table>
**Focusing**

**Open the hood:** Lift back of cover ① and raise to upright position.

**To Close:** Fold in two sides ②, pull back front.

**To Raise Magnifier:** Grip upper edge of hood with thumb and forefinger, press panel ③ gently inward.

**To Close:** Push magnifier support down ④.

---

**General Focusing Rule:**
*Always keep principle subject in sharpest focus.*

---

**To Focus:** Turn the focusing knob until the picture is pin-sharp, or until the two halves of the image meet in the Rangefinder Wedge (Centre of the view finder). When needed, use magnifier, holding it close to the eye. Footage numbers on the focusing knob should be used only to ascertain depth-of-field (→ page 16).

**To Open Sports Finder:** Press panel ⑤ all the way, until it catches.

**To Close:** Tap both sides of focusing hood gently, and flap will return to normal position.
Releasing

To Unlock Shutter Release: Swing the safety lever forward 7 (red mark visible).

Snapshot Exposure: Press shutter release inward 8, selected speed goes off automatically.

Time Exposure: Press release and hold for required time. Shutter will close when you let go.

Long Time Exposures: Press release 9 and lock with safety guard 10. Terminate exposure by releasing lock 11.

Cable Release: Insert in release socket with safety guard locked.

Setting the Self-Timer: After winding film, set knob 12 on V.

To Release Self-Timer: Press the shutter release 13 – shutter will open after approximately 10 seconds.

Speeds from 1/500th to 1 sec. can be used.

Shutter and self-timer may be left tensioned even when camera is not in use – spring strength will not deteriorate.
Exposure and Exposure Value

Exposure is adjusted in accordance with the prevailing illumination (more exactly: according to the brilliance of the light reflected by the subject) and the sensitivity of the film. The exposure value — formerly called the light value — serves as the measure of the correct exposure.

The exposure value regulates the correct combination of diaphragm and shutter speed within the permissible working range. The automatic coupling insures these settings and makes possible joint or simultaneous settings of both diaphragm and shutter. The practical advantage obtained is that one is immediately able to change from one speed or diaphragm stop to another, whether for motion stopping purposes or for depth-of-field differences, without bothering to recalculate and without danger of changing the basic exposure.

The exposure value for the given light condition and the sensitivity of the film in use is read off from the exposure table (page 15) or from the exposure meter (page 20) and then set on the scale of the camera (page 10). The table covers general light conditions and eliminates gross errors in exposure. Exact results however, especially in critical cases, can only be achieved with an electric exposure meter.

When using filters, exposure is extended according to the type and density of the filter. Accordingly minus values are supplied with the filters to be used for correcting the exposure values. The originally chosen exposure value is decreased by this correction value.

</tbody>
</table>
The Exposure Table

Subject brightness is easily judged and classified by means of the five standard lighting conditions represented by two illustrations.

Film speed is indicated at the left by ASA figures and at the right by DIN values (table page 23).

Exposure value is found where brightness and film speed columns cross.

Exposure value adjustment, due to overcast sky or when sun is lower in the sky, is made by use of lower scale. Upper scale: full sunshine — lower scale: overcast sky. The length and intensity of your own body's shadow will give some idea of light conditions. The ability to estimate and choose the correct exposure values for various lighting conditions and time of day will soon come when you begin working on sunny and cloudy days.

Example: Color film 100 ASA (21 DIN), landscape with foreground (C), sunny noontime (shadows short, no light value adjustment): light value 13. Available diaphragm-speed combinations: 1/500-f:4, 1/250-f:5.6, etc. Same subject in the afternoon, longer shadows, would require adjusted value, perhaps 13 - 1 = 12.

Explanations of the Picture Examples:

Depth of Field Indicator

Both before and behind the plane of sharp focus there is always a relatively sharp zone. The width or depth of this zone can be artfully increased. It increases in depth when either closing down the lens or moving back from the object on which you have focused. Therefore it is evident that if the subject requires an extended depth of field, it is necessary to change the diaphragm-shutter speed combination to one with a smaller stop or to move back with the camera.

The Depth of Field Indicator consists of the special diaphragm scale located next to the distance scale and the distance scale itself. Two stroke marks outline the zone covered by each diaphragm opening. The marks are located on either side of the distance indicator ▽, showing "before" and "behind," focus. The unnumbered diaphragm marks represent the stops 4, 8 and 16, respectively.

To Use: To find the limits of the depth of field, both before and behind the principal plane of focus, after focusing and after choosing the diaphragm opening. The beginning and end of the depth of field is read off on the distance scale. The sharp area lies between the distances bracketed by the marks extending from the diaphragm opening figure.

1. Example: focusing to 15 ft with diaphragm opening 11 gives a depth of field from 10 ft to 30 ft approx., focusing to 15 ft with diaphragm opening f:22 gives on the other hand a depth of field from 8 ft to ∞ approx. (Stopping down improves the depth of field.) Considerable stopping down necessitates greatly increased exposure time. To obtain depth of field with the largest possible diaphragm opening, a different method of focusing must be employed:

2. Example: the subject requires sharpness from 7 ft to 10 ft. (Other distances, if unknown, can be read directly off the scale after focusing separately to the limits required). Procedure: the focusing knob is turned until both footage values are located opposite identical diaphragm openings, and in this way the most favourable diaphragm opening is obtained, in this case f: 8 (page 24).
Flash Shots

Flash permits action shots even when prevailing light is too poor for hand-held snapshots.

To connect the flash unit: Push the plug into the flash socket ①. The plug locks automatically. To release it, push the locking ring ② downwards and pull out the plug.

The Synchro-Compur-X shutter is X-synchronised for all electrically fired types of flash.

Shutter speeds:
for electronic flash any speed up to 1/500 second,
for flash bulbs 1/30 second or longer.

The exposure depends on the light output of the flash and the distance from the flash to the subject. It cannot be measured with the exposure meter. The manufacturer's instructions with the flash unit give full details of the required shutter speed and aperture.

When setting the exposure, first select the shutter speed in the peep window, and then the aperture.
Changing the Camera Back

This is done only when changing to the plate adapter:

**Taking off the back:** Raise the back all the way and then slide, in the same direction, the safety lock lever on the right hinge ① until it reaches a stop. The back will then come off.

**Replacing the back:** Insert the back, in raised position, first into the left hand hinge, then the right. Of course, the safety lock lever must be up – lower back, which will automatically lock.

Important! When using the adapter: Remove the empty spool from the camera, taking care however to preserve it for the next use of roll film.

---

**Mask Set for 16 Frames**

The mask set is used to reduce the picture format and, simultaneously, to show the reduction in the ground glass and the sports finder. With the masks in place, B II 8 (120) film produces, instead of the normal 12 x 6 x 6 cm frames, **16 4 x 5.5 cm shots**. This picture size includes the important super miniature 4 x 4 format from which the well known Super-Slides are made. Edge notches are used to indicate the limits of this size.

**The film mask** – for both 4 x 5.5 and 4 x 4 – is inserted before loading the camera. Its insertion automatically switches over the counter mechanism. The white numbers 12 or 16 on the film frame counter dial indicate which of the numbering systems is in operation. Loading and winding as usual.

Either **ground glass mask** is used, depending on whether 4 x 5.5 or 4 x 4 is the desired format. They can be substituted one for the other at any time between shots. After removing hood and raising the ground glass, the desired format mask is placed over the 6 x 6 mask. Parallax compensation is automatically assured.

Either **sports finder mask** is fitted into place in front of the sports finder opening as needed.
Inserting the Film Mask: Insert the spring loaded side behind the film aperture frame 3, first below 2, then above.

Removing the Hood: Press both spring catches 4 and slide hood towards rear.
To replace: press hood down on track and slide forward until it locks.

To lift the ground glass: Take hold of the two sides of the frame, pull backwards slightly and lift 5. Close by pushing downward.

Inserting the Ground Glass Masks: Drop into place so that the notch and punched holes fit over the studs provided 6.

Inserting the Sports Finder Masks: Slip the straight edge under the lip of button 7. Fasten by pressing the side pins into the wells 8. Remove by lifting the tab 9.

Caution: Protect the mirror from dust. Do not touch with the fingers, do not rub. Wipe away dust with soft camel's hair brush. Remove any accidental finger prints with soft cloth.
The Exposure Meter, for subsequent installation

Detailed instructions for fitting are enclosed with every meter.

1 Control switch on nameplate: position 1 for normal light intensities, position 1a — red dot visible — for weaker illumination.

2 Exposure value indication: use window 2 for switch position 1, window 2a — edged in red — for switch position 1a.

5 Red setting pointer

6 Black indicator pointer

7 Adjustment of film type reminder

8 Film type indicator window

9 Lock screw to fasten meter in its bayonet socket

10 Setting window for ASA film speed ratings

11 Retaining knobs for diffusor
Measuring Exposure

Changing DIN/ASA film speed rating setting (necessary whenever a different film speed is used): turn adjusting ring 4 past the left or right click stop until the correct speed rating appears above the indicator mark.

To take reading: for reflected light measurement (➤ page 22): point camera towards subject or towards most important detail in subject – check in ground glass.

For incident light measurement (➤ page 23): snap diffusor into position, from above retaining knobs 11, over the photo cell. Turn camera around so that the photo cell faces the same direction towards the light as the subject.

Measuring exposure value: turn adjusting ring 4 until the red pointer covers the black indicating pointer – read the exposure value in the appropriate window 2 (red-edged window 2 a, when red dot is visible at the switch – 1 a). If the red pointer does not reach the black, change to higher sensitivity position with switch (1, 1 a).

The shock mounted exposure meter is ruggedly built and will withstand the strongest light for any length of time, in either switch position. It is not necessary, therefore, to cover the photo cell when not in use.

Checking and adjusting the meter

When the photo cell is completely covered, the black pointer should be in zero position, pointing to the short green line. If it is off this position, perhaps due to prolonged and heavy shaking, turn safety screw 9 until it stops. Turn meter towards the left to disengage from bayonet socket and remove. Adjust screw S on back of instrument until black indicator needle points to outer green reference mark. Re-insert instrument, lock into position and tighten safety screw.
Reflected (A) and Incident (B) Light Measurement

These two equally valuable methods of measurement permit Rollei to master all light conditions.

A general rule in strong sunlight: give preference to whichever measuring method that does not expose photo cell or diffusor to direct rays of the sun.

A. Reflected light or object measurement

The quick and convenient method especially suited to the Rolleiflex: aim at the subject (A). Measuring in this position covers the entire picture area, as seen on the ground glass screen. Meter reading, exposure value and focusing image can simultaneously be checked with camera in shooting position. Changes in light intensity can be observed instantly, even up to shooting time.

Using the reflected light method, a reading for the average brightness of the entire subject area is obtained. Application: evenly lighted subjects, for front or side lighting without heavy shadows in picture (standard lighting for color) and also for high contrast subjects when the light and shade areas are evenly apportioned throughout the picture. In special cases, detail measurement becomes very helpful: when either very light or very dark areas prevail, take individual readings of light and shade areas and use a mid-point value. The ground glass control image facilitates accurate measurement; it permits concentrating – by altering camera position – on most important elements of the picture or even to choose a nearby substitute object of the same brightness for reading.
B. Incident light measurement (with diffusor)

Instead of measuring the light reflected by the subject, this method measures the light as it falls on the subject. This is accomplished by attaching the diffusor over the photo-cell, to serve as a surface receiving the same illumination as the subject, and pointing the exposure meter in the opposite direction (B).

To get correct reading, aim from subject to intended camera position. In the open, when subject cannot be approached, aim the photo cell, turned around of course, along a line drawn from center of scene to camera. An exposure value of average scene brightness will result. When the important part of the scene is lighter or darker than the average, the measured exposure value should be corrected (usually 1/2 EV is sufficient). Position of the sun, special effects lightings, strong side or back lighting will have no influence on the proper reading and are disregarded. Detail measurements are not necessary, either.

Main uses: against-the-sun shots, strong backlighting, in shade with strong rays of sunshine, for objects with brilliant backgrounds (sky, snow, water, beach), for small objects as in Rolleinar shots.

Changing the Magnifier
(if eyesight demands)
For focusing without glasses, interchangeable magnifiers to adapt to one's eyesight are available in the range from +3 to -3 diopters (supply prescription for glasses). To remove, grasp lens from above and below, push against retaining spring (in the direction of the hinge), lift up and out. To insert, reverse procedure. Afterwards, clean with soft cloth.

Tripod pictures with the Rollei
Length of the tripod's screw must not exceed 3/16" (4.5 mm). If necessary, shorten screw or use washer of proper thickness to avoid damaging bottom of camera. A reducing bushing is available for use with smaller tripod screws. A practical accessory: Rolleiflex permits instant mounting or dismounting of camera to tripod.

For Quick snapshots
Setting camera to certain distances providing required depth-of-field has been found very effective when shooting in a hurry. Use as follows:

<table>
<thead>
<tr>
<th>Diaphragm f/8 Exposure 1/125th sec.</th>
<th>12 ft.</th>
<th>Short distances approx. 9 to 20 ft.</th>
</tr>
</thead>
<tbody>
<tr>

<td>Medium distances approx. 13 to 33 ft.</td>
</tr>
<tr>
<td></td>
<td>30 ft.</td>
<td>Longer distances approx. 18 to 120 ft.</td>
</tr>
</tbody>
</table>

Care of the Rolleiflex
A precision camera demands care in handling. Protect it against moisture, dust, sand, strong sunshine, hard blows or falls. First safeguard: the ever ready case. Proper camera protection is especially important on expeditions, in the tropics and for water sports. Use the metal ever ready case which is air-tight when closed and capable of floating. It provides sure protection against dust, humidity, splashes, windblown sand and blizzards. Carry camera around neck to minimize transportation shocks. Keep all parts clear and clean lenses with a soft camel's hair brush or doeskin. Although the mechanism is not unduly sensitive to cold, some condensation may form on the lenses when the camera is brought into a warm room from outside in cold weather. Do not wipe off - let moisture evaporate.

The task of repairing major or minor damage is the special province of the expertly trained mechanic. As part of their servicing organisation the Rollei Works maintain a special workshop in which all repairs are carried out with the traditional precision at cost price. Outside Germany please approach your photo dealer or the manufacturers' agent.
